

pyeon

Product Requirements Document (MVP)

Version: 1.0

Product Owner: Sun Yu

Last Updated: February 2026

Target Launch: Q2 2026

Executive Summary

pyeon is a mobile-first anxiety and panic attack support app designed for moments of acute distress. Unlike existing wellness apps that assume calm cognition, pyeon provides immediate, low-friction support through a guided flow: breathing exercises, grounding techniques, and safety contact access.

Problem Statement

Current State: During panic/anxiety attacks, users experience high cognitive load. Existing wellness apps require navigation and menu choices during crisis moments. Users encounter friction when they're least equipped to handle it.

User Pain Points: "I can't think clearly enough to find the right feature" • "Too many options overwhelm me" • "By the time I set up the app, the panic attack is worse"

Opportunity: Build a zero-friction support tool that works immediately, requires minimal decisions, and guides users from high-alert to calm state.

Success Metrics

Primary Metrics (MVP):

- Time to first action: < 3 seconds from app open to "Help me" button
- Session completion rate: > 60% complete full flow (breathing → grounding → check-in)
- Perceived effectiveness: > 70% report feeling calmer post-session

Secondary Metrics: Return usage rate (7-day), Average session duration (3-5 min target), Safety contact usage rate

Core User Flow (MVP)

Onboarding (First Time Only)

1. **Welcome Screen:** Brief explainer + "Get Started" CTA
2. **Name Input:** "What name makes you feel safest?" → Store as *preferredName*
3. **Safety Contact:** Contact picker from phone → Store *safetyContactName* + *phone*
4. **Ready Screen:** "You're all set" → Main Screen

Main Flow (Every Session)

Screen 1 - Main (Red #EF4444): Large pulsing "Help me" button, "{preferredName}, I'm here."

Screen 2 - Breathing (Red → Purple #A855F7): Animated circle with 4-7-8 breathing (Inhale 4s, Hold 7s, Exhale 8s). 3 cycles minimum, then "Ready to continue?" button appears.

Screen 3 - Grounding (Purple → Blue #3B82F6): 5-4-3-2-1 method. User taps to confirm: 5 things you see, 4 touch, 3 hear, 2 smell, 1 taste (15 total taps with progress indicator).

Screen 4 - Check-in (Blue): "{preferredName}, how are you feeling?" → "I feel better" (Success Screen) OR "I need more help" (Contact Screen).

Screen 5a - Success: "You did great, {preferredName}. You're safe." → Close returns to Main

Screen 5b - Contact: "It's okay to ask for help." → Call/Text {safetyContactName} OR Crisis Hotline (988)

Technical Architecture

Platform: React Native (iOS/Android) for single codebase, fast iteration

Data Storage: Local only (no backend for MVP). AsyncStorage or SQLite. Schema: User profile (preferredName, safetyContact info) + Session log (timestamps, completion status, outcome)

Color Transition System: Smooth gradients across screens

Screen	Color	Hex
Main	Alert Red	#EF4444
Breathing Start	Dark Red	#DC2626
Breathing End	Purple	#A855F7
Grounding	Light Purple	#8B5CF6
Check-in	Calm Blue	#3B82F6

UI/UX Specifications

Typography: System default (SF on iOS, Roboto on Android). Prompts 24px, Body 18px, Buttons 20px

Buttons: "Help me" = 80% width, 100px height, pill shape, pulse animation (2s loop). "Ready" = 60% width, 60px height, fade-in after breathing

Animations: Breathing circle smooth expand/contract (100-220px). Tap ripples with haptic feedback. Screen transitions fade+slide (100ms)

Accessibility: VoiceOver/TalkBack labels, WCAG AA contrast, dynamic type support, respect reduced motion preference

6-Week Implementation Plan

Phase	Timeline	Deliverables
Setup	Week 1	React Native project, navigation, storage, design system
Onboarding	Week 2	Welcome, name input, contact picker, data persistence
Breathing	Week 3	Main screen, breathing timer, animated circle, color transitions
Grounding	Week 4	5-4-3-2-1 UI, tap interaction, progress tracking
Check-in	Week 5	Check-in, success, contact screens, session logging
Polish	Week 6	Animation refinement, accessibility, user testing, bug fixes

Success Criteria for MVP Launch

Must-Have (Blockers): Full flow works without crashes • Smooth breathing animation • Contact deep links functional • iOS + Android support • Data persists between sessions

Should-Have: Smooth color transitions • VoiceOver/TalkBack functional • Fully offline • Session data logged

Out of Scope for MVP: User accounts, cloud sync, multiple breathing techniques, session history UI, notifications, social features, audio guidance, dark mode, multi-language

Market Differentiation

Competitors: Calm/Headspace (too much navigation), Rootd (cluttered UI), Dare (text-heavy)

pyeon's Edge: Fastest time-to-support (0 taps to "Help me") • Visual-first (minimal reading) • Single optimized path (no choice paralysis)

Research: 4-7-8 Breathing by Dr. Andrew Weil • 5-4-3-2-1 Grounding (evidence-based for panic/PTSD) • Red→Blue color psychology aligns with nervous system response
